The present sequence represents a transglutaminase of Streptoverticillium sp. . The specification describes a new microbial transglutaminase that has the N-terminal aspartic acid of the present transglutaminase deleted. Eliminating the N-terminal App from microbial transglutaminase allows efficient removal of the terminal Methionine residue added when the protein is expressed in Escherichia coli. The E. coli methionine aminopeptidase acts well on Met-Ser but only poorly on Met-Asp, so problems of antigenicity associated with Met-terminated proteins are avoided. Recombinant transglutaminase is used to produce galled foods (jellies, yogurt and cheeses) or cosmetics, to improve the quality of meat, in the production of materials for microcapsules of high thermal stability and as a carrier for immobilised enzymes. (Updated on 17-OCT-
                                                                                                                   New microbial transglutaminase with N-terminal aspartic acid deleted -allowing high level recombinant production without added methionine in E. coli, useful in production of gelled foods, cosmetics etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Coryneform bacteria; transglutaminase; food processing.

Matsui H;

WPI; 2001-266172/27

This invention relates to a process for the production of a foreign secretory protein through the construction of a recombinant coryneform bacterium. The coryneform bacterium is transformed with an expression construct in which DNA encoding a target foreign protein pro-structure is ligated to the downstream region of DNA encoding the signal peptide domain of a coryneform bacterial protein. Following transformation with the exector, the bacterium is cultured, and the pro-peptide cleaved from the expressed protein. Transgultaminases produced using this process are useful in the food processing and pharmaceutical industries. The present sequence represents a transgultaminase related protein, which can be used in the method of the invention. (Updated on 11-SEP-2003 to standardise OS field) Designing and constructing a variant of Streptoverticillium mobaraense-originated transplutaminase (MTG), for use in food processing, comprises estimating the binding site of MTG based on its stereo-structure. The present invention describes a method for designing and constructing a variant transglutaminase by estimating the binding site of Streptoverticillium mobaraense-originated transglutaminase (MTG) to the substrate based on the stereo-structure obtained by X-ray analysis of the crystalline structure of MTG crystals, and e.g. substituting amino acid crystalline structure of MTG crystals, and e.g. substituting amino acid. The method can be used for designing and constructing a variant transglutaminase. The obtained transglutaminases can be used in food processing. The modified transglutaminases have improved transglutaminase processing. The modified transglutaminases have improved transglutaminase required optimum ph. The present sequence represents a transglutaminase isolated from Streptoverticillium mobaraense (also called Streptomyces
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Protein encoded by high expression transglutaminase gene

WPI; 1999-062664/06. N-PSDB; AAV81508 New microbial transglutaminase with N-terminal aspartic acid deleted -allowing high level recombinant production without added methionine in E. coli, useful in production of gelled foods, cosmetics etc.

Example 1; Page 18-23; 56pp; English.

The present sequence is encoded by the high expression transglutaminase gene present in plasmid pTRPMTG-02. The gene is derived from

```
Streptoverticillium sp., and is codon altered, using oligonucleotides dAVB1521-60, for expression in Escherichia coli. The specification describes a new microbial transglutaminase that has the N-terminal aspartic acid of transglutaminase deleted. Eliminating the N-terminal from microbial transglutaminase deleted. Eliminating the N-terminal Met residue added when the protein is expressed in E. coli. The E. coli methionine aminopeptidase acids well on Met-Ser but only poorly on Met-Sep, so problems of antigenicity associated with Met-terminated proteins are avoided. Recombinant transglutaminase is used to produce gelled foods (jellies, yogurt and cheeses) or cosmetics, to improve the quality of meat, in the production of materials for microcapsules of high thermal stability and as a carrier for immobilised enzymes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes a method for producing active transglutaminase from denatured enzyme. The method comprises: (i) forming an intermediate structure of the enzyme having transglutaminase activity under acidic conditions in an aqueous medium; and (ii) forming a higherlevel structure of the enzyme having transglutaminase activity under neutral conditions in an aqueous medium. The method can be used for industrial production of active transglutaminase from denatured material (such as recombinant transglutaminase) which can be used in the food industry for the production of gelled foods such as jellies, yoghurts and

                                                                                                                                                                                                           à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes a method for designing and constructing a variant transglutaminase by estimating the binding site of Streptoverticillium mobaraense-originated transglutaminase (MTG) to the substrate based on the stereo-structure obtained by X-ray analysis of the crystalline structure of MTG crystals, and e.g. substituting amino acid residues located at the substrate-binding site of the transglutaminase. The method can be used for designing and constructing a variant transglutaminase. The obtained transglutaminases can be used in food
for the production of gelled cosmetics. The present sequence transglutaminase which is used in the exemplification from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Designing and constructing a variant of Streptoverticillium mobaraense-
originated transglutaminase (MTG), for use in food processing, comprises
estimating the binding site of MTG based on its stereo-structure.

that Ag is converted to crosslinked products. The pAg has virucide, antiparasitic, cytostatic, nootropic and neuroprotective activities, and can be used in vaccines. The method is neuroprotective activities, and can be used in vaccines. The method is useful in preparing immunogenic compositions, using disease-specific compounds optionally medified to include a (I)-reactive amino acid that are combined in crosslinking solution then treated with (I), that can be used as vaccines. PAg, and other related antigenic compositions, are useful in human and veterinary medicine, particularly as vaccines, for treatment and prevention of infections (viral, bacterial, fungal or parasitic), cancers and Alzheimer's disease, also of immune-related or autoimmune diseases. Antibodies against pAg are useful as diagnostic reagents and crosslinked proteins can also be used industrially, e.g. in food or leather processing, in cosmetics and as enzyme carriers. The present sequence represents a Erreptomyces mobaraensis transglutaminase (EC 2.3.2.13), which is used in an example from the present invention.
crosslinking solution with a biological agent (I); and (ii) incubating

Prepn.

A fused protein contains amino acids 16-346 of BTG (AAQES983) and a hydrophilic peptide at the amino terminal. Expression of DNA encoding this protein in E. coli allow large scale prodn. of BTG. An active BTG can be prepd. from the inactive fused protein inclusion body. (Updated on 10-MAR-2003 to add missing OS field.) of bacterial trans-glutaminase in large amts. - by expression of protein in E. coli bacterial trans-glutaminase. Claim 1; Page 7-8; 13pp; Japanese. fusion 

The present invention describes a method for producing a polyvalent antigen (pAg). The method comprises: (i) treating an antigen (Ag) in a crosslinking solution with a biological agent (I); and (ii) incubating so that Ag is converted to crosslinked products. The pAg has virucide, antibacterial, fungicide, antiparasitic, cytostatic, nootropic and

neuroprotective activities, and can be used in vaccines. The method is useful in preparing immunogenic compositions, using disease-specific compounds optionally modified to include a (I) reactive amino acid that are combined in crosslinking solution then treated with (I), that can be useful in human and veterinary medicine, particularly as vaccines, are useful in human and veterinary medicine, particularly as vaccines, for treatment and prevention of infections (viral, bacterial, fungal or parasitic), cancers and Alzheimer's disease, also of immune-related or autoimmune diseases. Antibodies against pAg are useful as diagnostic reagents and crosslinked proteins can also be used industrially, e.g. in food or leather processing, in cosmetics and as enzyme carriers. The present sequence represents a Streptomyces mobaraensis recombinant 6X-His transgluteminase (EC 2.3, 2.13) fusion protein, which is used in an example from the present invention.  $^{8}$

New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess Claim 20; SEQ ID NO 52571; 103pp; English. biodiversity

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used

in diagnostics as expressed sequence tags for identifying expressed

crossed (I) is useful in gene therapy techniques to restore normal

crossed (II) or to treat disease states involving (II). (II) is

crossed (II) or to treat disease states involving (II). (II) is

crossed (II) or to treat disease states involving or quantitating a second in a crossed (II) or to treat in the crossed (II) is an expression or bological in medical imaging or supplement. (II) and its binding partners are useful in medical imaging or supplement. (II) and its binding partners are useful in medical imaging or supplement. (II) and its binding partners are useful in medical imaging or supplement. (II) and its binding partners are useful in medical imaging conviving aberrant protein expression or bological activity. The polypeptide and polymucleotide sequences have applications in crossed dispensations. Crossed and produce of mutations in the product of death or traits to assess blodiversity and to produce other types of data and products dependent on DNA and amino acid sequences of the invention. Note: The sequence data for this crossed in the printed specification, but was obtained in celectronic format directly from WIPO at

crossed in details and produces are sequenced at a for this expense in the printed specification, but was obtained in convenient or the printed produces are sequences. ```
The mature transglutaminase enzyme (BTG) can be derived from two different species. Streptoverticillium and Actinomycetes. It catalyses an acyl rearrangement reaction of a gamma-carboxyamide gp. of glutamine. It introduces intra- or intermolecular formation of epsilon-(gamma-Gln)-Lys cross-linking when an epsilon-amino gp. of a Lys residue acts as an acyl conversion of Gln residues to Glu residues by deamination. The enzyme is used in the prodn. of gelled foods, gelled cosmetics, yogurt, gelatin, cheese etc. It is also used in the prodn. of thermally stable materials sequence given allows the prodn. of BTG efficiently and in large quantity. (Updated on 25-MAR-2003 to correct PA field.) (Updated on 25-MAR-2003 to correct PA field.)

This invention relates to a process for the production of a foreign secretory protein through the construction of a recombinant coryneform bacterium is transformed with an expression construct in which DNA encoding a target foreign protein pro-structure is ligated to the downstream region of DNA encoding the signal peptide domain of a coryneform bacterial protein. Following transformation with the vector, the bacterium is cultured, and the pro-peptide cleaved from the expressed protein. Transglutaminases produced using this process are useful in the food processing and pharmaceutical industries. The present sequence prepro-transglutaminase. The protein is used in an example illustrating the method of the invention. (Updated on 11-SBP-2003 to standardise OS field) Bfficient secretory production of foreign proteins e.g. transglutaminase employing transformant coryneform bacterium, simply on industrial scale with direct recovery for use in food processing and pharmaceutical Example 1; Page 90-93; 151pp; Japanese. industry.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a method for producing a foreign protein by culturing a mutant strain of a coryneform bacterium that contains an expression gene construct to secrete the foreign protein, followed by recovery of the produced foreign protein. The gene construct is obtained by ligation of a nucleic acid encoding a signal peptide domain originating from a coryneform bacterium, to downstream of a functioning promoter sequence in the coryneform bacterium and also by ligation of a nucleic acid encoding a foreign protein, to downstream of a nucleic acid sequence encoding the signal peptide. The method is useful for the production of a foreign protein, which is applicable in producing e.g. industrially-useful transglutaminase and human epithalial growth factor for use in medicine, cosmetics and food processing. This sequence represents a foreign protein of the invention. (Updated on 23-OCT-2003 to

```

```
A fused protein contains amino acids 16-346 of BTG (AAQ55983) and a hydrophilic peptide at the amino terminal. Expression of DNA encoding this protein in E. coli allow large scale prodn. of BTG. An active BTG can be prepd. from the inactive fused protein inclusion body. (Updated on 10-MAR-2003 to add missing OS field.)
                                                                                                                                                                                                                                                   40

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             RESULT 12
                                                                                                                                                                                        RESULT 11
                                                                               8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 616, Application US/09976594

Patent No. 6673549

GENERAL INFORMATION:
APPLICANT: Buchbinder, Jenny
TITLE OF INVENTION: GENES EXPRESSED IN C3A LIVER CELL CULTURES TREATED WITH STEROIDS
TITLE OF INVENTION GENES EXPRESSED IN C3A LIVER CELL CULTURES TREATED WITH STEROIDS
TITLE OF INVENTION UNMERS: US/09/976,594
CURRENT APPLICATION NUMBER: US/09/976,594
CURRENT PILING DATE: 2001-10-12
PRIOR APPLICATION NUMBER: 60/240,409
PRIOR FILING DATE: 2000-10-12
NUMBER OF SEQ ID NOS: 1143
                                                                                                                                                Sequence 5, Application US/10022809A

Patent No. 6150502

GENERAL INFORMATION:
APPLICANT: Strachan, Lorna
APPLICANT: Strachan, Lorna
APPLICANT: Steeman, Matthew
APPLICANT: Onrust, Rene
TITLE OF INVENTION: Compositions Isolated From Skin Cells
TITLE OF INVENTION: Onmpositions Isolated From Skin Cells
TITLE OF INVENTION: And Methods For Their Use
FILE REFERENCE: 11000.1011c1
CURRENT APPLICATION NUMBER: US/09/188,930A
CURRENT FILIG DATE: 1998-11-09
NUMBER OF SLOG ID NOS: 348

SOFTWARE: FastSEQ for Windows Version 3.0

US-09-489-0394, Application US/09489039A

Sequence 9994, Application US/09489039A

Patent No. 6610836
GENERAL INFORMATION
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO KLEBSIELLA
TITLE OF INVENTION: PREMOVELE ROS DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: PREMOVELE 2709-2004001
CURRENT FELING DATE: 2709-2004001
CURRENT FELING DATE: 2000-01-27
PRIOR PILING DATE: 1999-01-29
NUMBER OF SEQ ID NOS: 14342
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               271

                 Sequence 2, Application US/09060854B
Patent No. 6642011
Patent No. 6642011
APPLICANT: Estell, David Aaron
TITLE OF INVENTION: Human Protease and Use of Such Protease for Pharmaceutical
TITLE OF INVENTION: Applications and for Reducing the Allergenicity of No. 6642011-H
TITLE OF INVENTION: Proteins
TITLE OF INVENTION: Proteins
FILE REFERENCE: G532
CURRENT APPLICATION NUMBER: US/09/060,854B
NUMBER OF SEQ ID NOS: 7
SOFTWARE: FateSEQ for Windows Version 3.0
SEQ ID NO 2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 7, Application US/09627650B

US-08-117-844B-56

Sequence S6, Application US/08317844B

Patent No. 5989894

GENERAL INFORMATION:
APPLICANT: Lewis, Randolph V.
APPLICANT: Hinman, Michael B.
TITLE OF INVENTION: ISOLATED DNA CODING FOR SPIDER SILK
TITLE OF INVENTION: CONTAINING THE ISOLATED DNA, AND PRODUCTS THEREOF

NUMBER OF SEQUENCES:
CORRESPONDENCE ADDRESS:
ADDRESSEE: Birch, Stewart, Kolasch & Birch
STREET: 301 No. 5989894th Washington Street
